

*For over 60 years, this little-known investment Ratio has been set at 15.2. Only 6 times in the last 30 years has the ratio been skewed the way it is today...*

## **How You Can Turn \$10,000 into \$42,700 in Just 7 Months with the “Secret Gold-to-Oil Ratio”**

*Every time the Ratio has hovered around 11 as it is right now, there has been a strong correction in the price of gold, bringing the ratio back into alignment - and creating huge profits for in-the-know investors.*

*Conditions are prime for it to happen again – but your window of opportunity is going to close in just a few weeks. In this report, I’ll show you how smart investors are already locking-in profits of more than 427%, and how you can too...*

Dear Profit-Seeking Investor:

How many times have you read a recommendation to invest in a company only to discover that by the time you have the information in your hands, the opportunity for “huge gains” has passed you by?

Imagine if there was a formula you could follow that would show you when to invest and what to invest in – so you could get in early and take advantage of those huge gains before everyone else caught on?

Well what I’m going to share with you today has the potential to do just that. It’s known as the “**Gold-to-Oil Ratio**” because it signals investors exactly when to buy gold and oil to ensure the greatest return on investment. I call it “secret,” because while it may be well known by the Warren Buffet’s of the world, it’s been virtually unknown to the average investor.

**That is, until now.**

This “Gold-to-Oil Ratio” has been returning profits for “in-the-know” traders for over 60 years – and I’m going to show you how they do it – how they have been able to reap returns of 393%, 41% and 63% using the “**Secret Gold-to-Oil Ratio.**”

But more importantly, **I’m going to show you how you can use the Ratio to bank profits of up to 427% by this summer!**

Now don’t worry – the beautiful thing about this “Ratio” is its simplicity. The real key to the Ratio, though, is not knowing **what** the Ratio is - ***it’s in knowing exactly how to use the Ratio to reap substantial gains.***

Let me explain...

My name is **S.R. Nunnally** and I’m the editor of **Material Profits**, the nationally renowned and respected independent investment research company that targets commodity stocks with explosive growth and profit potential.

I spend my days scouring the globe, pegging the most profitable investment opportunities for my readers, and revealing techniques to safeguard your portfolio from inflation while finding ways to skyrocket your profits.

It’s no surprise then that I spend a lot of time researching two of the world’s most sought-after and profitable commodities – **gold and oil.**

Gold has long been known as a powerful hedge against inflation, and the oil profits of recent years are legendary. But what few people fail to realize is that there is a little-known, “secret” correlation **between gold and oil – one that can be very lucrative - *IF you know how to play it.***

That’s where my “**Gold-to-Oil Ratio Report**” comes in.

You see, for the past 60 years, one ounce of gold has been able to buy (on average) 15.2 barrels of oil. That 1:15.2 ratio has remained quite constant – in fact, every time an ounce of gold buys less than 11 barrels of oil, we’ve witnessed a strong correction that brings gold and oil back into that ratio.

{**Insert Sidebar Quote:** “The recent run in gold has moved in conjunction with rising crude prices’ David Meger, senior metals analyst at Alaron Trading said in a recent note. And gold prices also began to jump higher in the third quarter of last year, concurrent with an oil price surge.” CNNMoney.com}

For instance:

- In 1976, the ratio was 8.2. Within just four years, gold rose 393% (from \$124.71 to \$614.61). A \$10,000 investment became \$39,300.

- In 1985, the ratio was 10.6 (almost where it is today). Gold prices rose 41% (from \$317.18 to \$446.28). A \$10,000 investment became \$14,100.
- In 2001 the ratio had dipped to 8.1. Gold rose 63% (from \$272.67 to \$444.47). A \$10,000 investment became \$16,300.

As of January 19th, gold has climbed to \$635 an ounce, and oil is at \$51 a barrel – and climbing. That’s a ratio of 1:12.4. As the cold weather hits the country this month, oil is going to keep climbing higher, meaning the ratio will drop below 11 within the next few weeks – when oil gets back to \$60 a barrel, **the Ratio will be at 10.6 – a far cry from the historical constant of 1:15.2.**

That means that as you read this, we’re in prime market conditions for you to use my “***Gold-to-Oil Ratio Report***” **to make a lot of money!**

But, you’re going to have to act fast on this one. Gold prices are already creeping up, rising 6% in just the last few days. It won’t be long before the ratio is reset to 1:15.2 - and then it will be too late – you’ll have missed your chance for huge profits.

{**Insert Sidebar Quote:** “Gold remains an attractive asset for investors seeking above market returns. Gold could challenge its all-time peak of \$850 an ounce, reached in 1980, helped by bullion’s growing importance as an alternative investment and rising risk aversion among investors.” Stephen Walker, Director of Global Mining Research at RBC Capital Markets – Financial Times, 11/9/06}

The good news is you aren’t going to have to clear out your garage and start stockpiling gold bars to take advantage of this profit opportunity. Sure – you could go out and invest in gold or oil on your own, and probably get a return in the neighborhood of 20 - 30% or so – which is nothing to sneeze at!

But this opportunity is so good – why would you want to settle for just 30%? I’ve found a way for you to use the “***Secret Gold-to-Oil Ratio***” **right now to bank up to a 427% return on your money, turning a \$10,000 investment into \$42,700 – within the next 7 months!**

***Here’s how...***
